+923115778343 | Haseebarshad992@gmail.com | [Haseebarshad.me](https://haseebarshad.me) | [github](https://github.com)

Founding Engineer and AI engineer with 3+ years shipping **full-stack products, secure microservices, GTM and lead-generation systems, and agentic AI workflows**. Built production platforms spanning million-record parts search, **real-estate lead management**, secure authentication, and AI-powered decision support, contributing to ~30% sales growth. Strong across **TypeScript/Node.js, Next.js, NestJS, PostgreSQL**, Redis, Elasticsearch, Docker, Clay, Heyreach, Apollo, RAG, MCP, and production/workflow automation.

WORK EXPERIENCE

Summon Electronics

Remote

Founding Engineer

November – Present

- Own architecture and delivery across product, platform, data, AI, and GTM; authored and refactored production microservices to replace tightly coupled flows with independently deployable services.
- Designed and deployed an always-on internal agentic AI system on top of a locally hosted Qwen3.6 model on DGX Spark, using iterative reasoning/execution loops, internal tools, dynamically retrieved business context, and persistent workflow state to support sourcing, sales, and operational decisions.
- Built a high-throughput electronic-parts data platform handling millions of component records and achieving ~1 ms indexed retrieval, surfacing low-latency results directly in frontend sourcing and sales workflows.
- Built a dedicated lead-management and sales-intelligence system with tracked-link attribution, detailed prospect/account identification, lead enrichment, salesperson ownership, and GTM automation; integrated Apollo.io, Clay, and HeyReach, helping increase sales by 30%.
- Architected a secure authentication service using RS256/JWKS asymmetric JWT signing, OAuth 2.0, Redis-backed revocation, refresh-token rotation, reuse detection, and immediate invalidation - eliminating shared signing secrets
- Built an AI-powered agentic intelligence system integrated into team messaging, giving sales and operations teams on-demand access to sourcing, lead, and historical business context for faster decisions
- Containerized and deployed production services with Docker on DigitalOcean, balancing low-latency performance, secure state management, and operational reliability.

Key Technologies: Microservices, Scalable Architecture, Asymmetric Signing, NestJS, TypeScript, JWT (RS256/JWKS), OAuth 2.0, Redis, MySQL, Docker, DigitalOcean, Token Rotation, Revocation, AI agents

REMAP AI

Remote

Full-Stack Developer

March 2025 – Nov 2025

- Architected and built the core AI-agent platform end to end, implementing reasoning loops, RAG pipelines, tool orchestration, and PostgreSQL/pgvector memory services in Node.js.
- Led full-stack delivery of Next.js agent experiences and Node.js/GraphQL APIs, turning complex AI workflows into responsive product journeys while maintaining 95+ Lighthouse scores.
- Containerized microservices with Docker and automated releases through GitHub Actions CI/CD, sustaining 99.9% uptime and reducing incident-response time by 30%.
- Integrated product and operational systems with n8n automation, removing manual handoffs and making deployment and incident-response workflows repeatable.

Key Technologies: Next.js, Node.js, PostgreSQL, pgvector, GraphQL, RAG, AI Agents, Tool Orchestration, n8n, Docker, GitHub Actions, CI/CD, DevOps

- Engineered and optimized data-intensive Next.js applications, reduced dataset load time by optimizing queries and indexing, enabling users to explore millions of records in milliseconds.
- Architected a **Bento-style link-in-bio platform**, designing its application structure, data model, dynamic profile and link-management flows, and backend integrations for scalable user-generated pages.
- Owned end-to-end delivery, reducing handoffs by 40% and shipping features 2–3 weeks faster than team baseline

Key Technologies: Next.js, Node.js, MongoDB, RESTful APIs, SVG, WebGL, Geospatial Visualization, UI Component Systems, Database Optimization, System Architecture, Performance Optimization

Almaymaar

Islamabad, Pakistan

Frontend Developer

May 2023 – April 2024

- Engineered Almaymaar's full-stack **real-estate sales platform**, connecting property discovery, customer inquiries, prospect data, lead routing, and sales follow-up workflows across the customer lifecycle.
- Built and launched **theharsukh.com**, developing the production web experience for Harsukh Residencies with Next.js and backend services supporting property information, customer acquisition, and lead-generation workflows.
- Integrated frontend, backend, and real-estate data workflows into a unified system, turning the public website into an operational acquisition channel rather than a standalone marketing site.

Key Technologies: Next.js, Node.js, JavaScript, REST APIs, WebSockets, SSR, Backend APIs, Real-Estate Platforms, Lead Management, Full-Stack Development, SEO and Performance Optimization,

PROJECT EXPERIENCE

Incillum - Persistent intelligence system for enterprise operations ([link](#))

- Building an AI system that never sleeps and maintains context and responsibility across work lasting hours, days, or longer rather than operating as a single-session chatbot.
- Built evidence-backed Review workflows with structured findings, source provenance, human corrections, exceptions, and deterministic calculations.

Orixa - AI Agent Marketplace & Orchestration Platform ([github](#))

- Built a task marketplace where humans post work and AI agent browse, claim, plan, execute, take feedback and submit results for reputation credits, using a layered skill/tools/software architecture.
- Designed external-agent access over REST and MCP, orchestration and reviewer flows, state transitions, and GitHub workflow/check automation with Next.js, TypeScript, PostgreSQL, Drizzle, and automated verification

Sayings - Voice-Based Social Media Platform ([github](#))

- Designed and built a voice-first social platform that converts spoken posts into structured, searchable content through speech-to-text, emotion analysis, topic extraction, and AI-generated personality insights.
- Integrated AssemblyAI, Hume AI, Grok, and IPFS-based media storage into an end-to-end pipeline spanning recording, transcription, enrichment, personalized feeds, and user interaction.

CodingCam - Real-Time Developer Analytics Platform ([github](#))

- Architected an end-to-end developer analytics platform spanning a lightweight VS Code telemetry extension, backend ingestion services, and an interactive analytics dashboard for understanding coding activity across projects and languages.
- Engineered real-time activity and idle detection that captures file, project, language, and focused-session context and securely streams events to backend services for reporting, visualization, and productivity insights.

TraceCLI - Privacy-First AI Productivity Intelligence Platform

- Engineered a local-first activity intelligence platform that continuously captures application usage, browser context, search activity, focus sessions, and system-resource signals while keeping sensitive activity data on-device.
- Designed a multi-table SQLite analytics layer and natural-language AI interface that converts productivity questions into structured data queries, enabling users to analyze work patterns, distractions, and long-term focus trends directly from the terminal.

SKILLS & EXPERTISE

AI & Agentic Systems: RAG, AI Agents, Agent Orchestration, Tool Calling, MCP, LLM Integration, OpenAI APIs, Google Gemini, Embeddings, Vector Search, loop Engineering, Context & Memory Systems, n8n Automation

Backend & Platform Engineering: Node.js, TypeScript, NestJS, Express.js, Go, Python, Microservices, REST APIs, GraphQL, WebSockets, OAuth 2.0, JWT, RS256/JWKS, Session Management, API Architecture, Caching

Data, Search & Storage: PostgreSQL, pgvector, MongoDB, MySQL, Redis, Elasticsearch, Supabase, Prisma, Mongoose, Sequelize, Vector Databases, Full-Text Search, High-Volume Data Processing

Frontend Engineering: React, Next.js, TypeScript, Redux, Tailwind CSS, SSR/SSG, Responsive & Accessible UI, SVG, WebGL, Geospatial Visualization, Core Web Vitals, Performance Optimization

Cloud & DevOps: Docker, Kubernetes, GitHub Actions, CI/CD, DigitalOcean, Vercel, Git, Linux, TLS/SSL, CDN, Deployment Automation

Engineering Practices: System Design, Database Design, Microservice Architecture, Performance Optimization, Authentication & Authorization, Unit & Integration Testing, Code Reviews, Technical Design Documents

EDUCATION

FAST National University of Computer and Emerging Sciences

Islamabad, Pakistan

Bachelors in Computer Science BS(CS)

CERTIFICATIONS

- Earned Udacity's React Nanodegree, mastering advanced React concepts through project-based learning; Completed LinkedIn's React Essential Training.
- Completed 365 Data Science's SQL + Tableau + Python certification, gaining proficiency in data analysis, visualization, and programming.
- Acquired foundational knowledge of cloud-based machine learning through Udacity's AWS Fundamental course in AWS Machine Learning.
- Completed the 60-day Udacity challenge.
- Attended Fast-Nuces' 2019 Artificial Intelligence workshop, exploring cutting-edge AI applications.
